Upgrading oemPro

IMPORTANT

In order to upgrade, at least oemPro v3.3 must be installed on your server.

BEFORE WE BEGIN

In this manual, it is assumed that your website URL is <http://www.mydomain.com> and oemPro is installed to the root of your website (<http://www.mydomain.com/oempro>). Do not forget to change this URL to the correct one on your server.

HOW TO UPGRADE FROM V3.3.x TO V3.5

Unzip v3.5 package to a directory on your computer and upload all these files to the oemPro directory on your server (old files will be overwritten).

- Open your web browser and enter the below URL with the correct path on your server. <http://www.mydomain.com/oempro/system/install/upgrade/>. Upgrade screen will be displayed.
- Click on the Proceed to step 2 of 3 button
- Once you are on the step 2 – you will see the license agreement – please tick both the boxes and then click on the Proceed to step 3 of 3 button.
- Once you click on the step 3 button you should see the quick overview of the system requirements – whether your existing directory permissions and the PHP installation pass these requirements or not. If everything is ok you may click on the Start Upgrade Process button.

That's it – the oemPro upgrade script will do the needful to upgrade it to the latest version 3.5. Once done it will pop up a screen telling whether the upgrade process was completed correctly or not.

IMPORTANT:

Please ignore "oempro/system/data/templates/" directory while uploading if you have customized the existing templates. If you fail to do that the customized templates will be replaced by the default templates which are included with oemPro.
